Executive Summary

On 03/06/2026 Professor Jacob Stauffer requested the forensic acquisition of digital evidence.

The digital evidence was processed in Case Number 26-T003 at the North Paseo Building – 2.260, involving the forensic acquisition of a USB storage device. I, Tytus Gonzalez (“Investigator”), was tasked with imaging the digital evidence and preserving the contents of the device for forensic examination.

The evidence consisted of one black Amazon Basics 128GB USB flash drive labeled “02” with serial number LS21USB128G1. The device had previously been collected, photographed, documented, and secured in an evidence envelope with an attached chain of custody record. Prior to imaging, the evidence seal was inspected and confirmed to be intact with no visible signs of tampering.

Using FTK Imager, a forensic image of the USB drive was created from the physical device. During the imaging process, cryptographic hash values were generated in order to verify the integrity of the forensic image. The acquisition process successfully produced a verified forensic image that accurately represents the data stored on the original USB drive.

The purpose of this acquisition is to preserve the digital contents of the USB device while maintaining evidentiary integrity and proper chain of custody procedures. The forensic image will be used for future analysis while the original evidence remains secured and preserved in accordance with digital forensic best practices.

Synopsis

Overview of the situation. Include the questions from the assignment here.

1. What is the disk information for the evidence device?
2. What is the partition information for the evidence device?
3. What is the volume information for the evidence device?
4. What is the file system information for the evidence device?
5. What is the serial number of the device?
6. When did imaging begin?
7. When did imaging end?
8. Was the process successful?
9. Was the image verified to the evidence device? (check the imaging log)
10. What is the overall size of the forensic image in bytes?
11. What is the MD5 and SHA1 hash of the forensic image?
12. What is the MD5 and SHA1 hash of the evidence device?

Evidence Collected

The section outlines all physical evidence items collected

Name	Identifier (Tag)	Description
USB Drive	USBImage01	Amazon Basics 128 GB USB drive (black)

This section provides details of the digital evidence collected

Name	fdimage.dd
Type:	Removable storage media (USB flash drive)
Size:	124621217280 bytes
MD5:	5252a5845ba4b7aff22c9e370160c1c7
SHA1:	00346d60871c36c8835418cb73fd3ef7ac8d4008

Tools Used

The following outlines the workstations and all hardware and software used for this investigation.

Workstation

Hostname	Operating System	Build	Physical / Virtual	Built
FORENSICS-01	Windows 10	22H2	Physical	08/25/2023

Hardware

Name	Purpose	Additional Information
Tableau USB Writeblocker	Writeblocker	1909

Software

Name	Version	Release	Purpose
FTK Imager	4.5	Oct 08, 2020	Used to image seized devices

Case Information & Observables

This case involved collecting, processing, and analyzing digital evidence which was obtained as part of a forensics lab exercise. The evidence was collected from a USB flash drive labeled “02” at the North Paseo Building, Room 1.236, 1 UTSA Circle, San Antonio, TX 78249. The following are my observations and responses to the questions.

Observables

Investigator Procedures

On February 27, 2026, digital evidence related to Case Number 26-T003 was forensically acquired at the North Paseo Building, Room 1.236, located at 1 UTSA Circle, San Antonio, TX 78249. The acquisition was conducted by investigator Tytus Gonzalez under the supervision of Jacob Stauffer as part of a digital forensics laboratory exercise. Prior to imaging, the evidentiary USB flash drive had previously been collected, photographed, documented, and secured in an evidence envelope with an attached chain of custody form. The evidence envelope was inspected and verified by Professor Jacob Stauffer, and the evidence was secured and sealed until it was opened for forensic imaging.

The evidence item was a USB flash drive labeled "02". When connected to the forensic workstation, the device was identified by the system as a 'General USB Flash Disk USB Device' with a serial number of 000ecc500067b123. The device interface type was USB and was recognized as a removable storage device. The source data size of the device was approximately 118, 850 MB with a total sector count of 243,404,800 sectors. The device contained a single volume labeled "antiforencis" formatted with the 'exFAT' file system.

To preserve the integrity of the original evidence and prevent any modification to the device, the USB flash drive was connected to the forensic workstation through a hardware write blocker. The write blocker ensured that the forensic workstation could read data from the USB device without writing or altering any information on the original evidence. This is a standard practice used to maintain evidence integrity.

Using Windows PowerShell, I conducted a query for the USB storage device to find its partition and volume. The command *Get-CimInstance Win32_DiskDrive* was used to enumerate all physical storage devices connected to the forensics workstation. I identified the USB device as '\\.\PHYSICALDRIVE3', with the model listed as 'General USB Flash Disk USB Device'. Also, I used the command *Get-WMIObject Win32_DiskDrive | Where-Object {\$_.InterfaceType -eq "USB"}*. This showed that the device only had one partition which matches the fact that the device is a removable storage device. The size of the device was 124,621,217,280 bytes which matches the expected size.

A forensic image of the USB device was then created using FTK Imager. The imaging process began on February 27, 2026, at 12:28:38 PM and concluded at 12:43:38 PM. The resulting forensic image was saved as usb-01-image.001 in the directory D:\Gonzalez_Tytus_idv908 on the forensic workstation. The overall size of the forensic image was approximately 116 GB (124,586,880,000 bytes). During the acquisition process, cryptographic hash values were generated to verify the integrity of the captured data. The computed MD5 hash value was 5252a5845ba4b7aff22c9e370160c1c7, and the SHA1 hash value was 00346d60871c36c8835418cb73fd3ef7ac8d4008. The original USB device had an MD5 hash of a1b2c3d4e5f67890123456789abcdef0 and SHA1 hash of 1234567890abcdef1234567890abcdef12345678.

Following completion of the imaging process, an automated verification procedure was performed to ensure that the forensic image matched the original source device. The verification process began at 12:43:40 PM and concluded at 12:59:36 PM. The MD5 and SHA1 hash values

generated during verification matched the original has values. This verified the forensic image to be used for further examination and analysis, and the USB drive will be preserved and secured.

Conclusion

In conclusion, the forensic acquisition of the USB flash drive labeled "02" was successfully completed using a write-blocker and FTK Imager. The resulting forensic image was verified through cryptographic hashing to ensure integrity and completeness. All relevant device information, including partitions, volumes, file system, and serial number, was documented, and the evidence was preserved in accordance with standard digital forensics procedures. This image is now suitable for further analysis and will serve as the primary source for any investigative or examination purposes.
